

Version 2.3

March 2024

Integrate Azure AD with Cohesity SSO

*Enable Seamless Azure AD Single Sign-On
Authentication and Security for Cohesity*

ABSTRACT

Your organization is dynamic; strengthening agility and flexibility without compromising on security is a balancing act. Single Sign-On (SSO) solutions help solve authentication and identity challenges while providing additional benefits. Cohesity provides seamless SSO support for entire clusters as well as organizations in multi-tenant clusters.

Figure 3: Cohesity Access Management with Azure AD SSO Lifecycle	8

Single Sign-On (SSO) Benefits

When you streamline your organization's infrastructure with SSO capabilities, the complex tasks of managing all its components become more efficient for administrators across systems. You also gain many other benefits in the process, including:

- Increased compliance and security
- Easier collaboration between vendors and partners
- Productivity gains
- Improved user auditing
- Improved application adoption
- Better user experience for employees
- Fewer support cases

Role-based access control (RBAC) restricts system access based on a user's role within an organization and has become one of the main methods for advanced access control. The roles in RBAC refer to the levels of access that users have to a Cohesity cluster.

Cohesity's SSO integration supports three RBAC methods: Default, Individual User-based, and User Groups-based.

Default RBAC

The default role associated with the SSO configuration is applied to all users who log in using the given identity provider (IdP).

To use default RBAC, you need to [pass the "Email" or the "Login" SAML attribute](#) to Cohesity.

Individual User-based RBAC

In our integration, you can also assign custom roles to individual users. For example, all users have Viewer roles by default, and you can [create SSO users](#) on Cohesity so that individual users have admin roles as required.

As with default RBAC, to use user-based RBAC, you need to [pass the "Email" or the "Login" SAML attribute](#) to Cohesity.

NOTE: If a custom role is provided, the default role is not used. For example, if the default role is Admin and a user is assigned the Viewer role, that user won't be able to perform admin-only operations.

User Groups-based RBAC

User groups-based RBAC is the most common use case, as you can assign the same role to all users in the group in a single action.

For example, all users might have the [Viewer role by default](#). You can then [create an SSO group on Cohesity](#) called “cohesity_admins” and give that group the Admin role. Now, every user in the “cohesity_admin” group also has the Admin role.

To use groups-based RBAC, you need to [pass the “Email” or “Login” SAML attribute](#) and [pass the “Groups” SAML attribute](#) to Cohesity.

NOTE: If a user is assigned a custom role, and also gets a role from the group, that user has both roles. For example, if a user in the “cohesity_admin” group is also assigned the Data Security role, the user gets both the Admin and the Data Security roles.

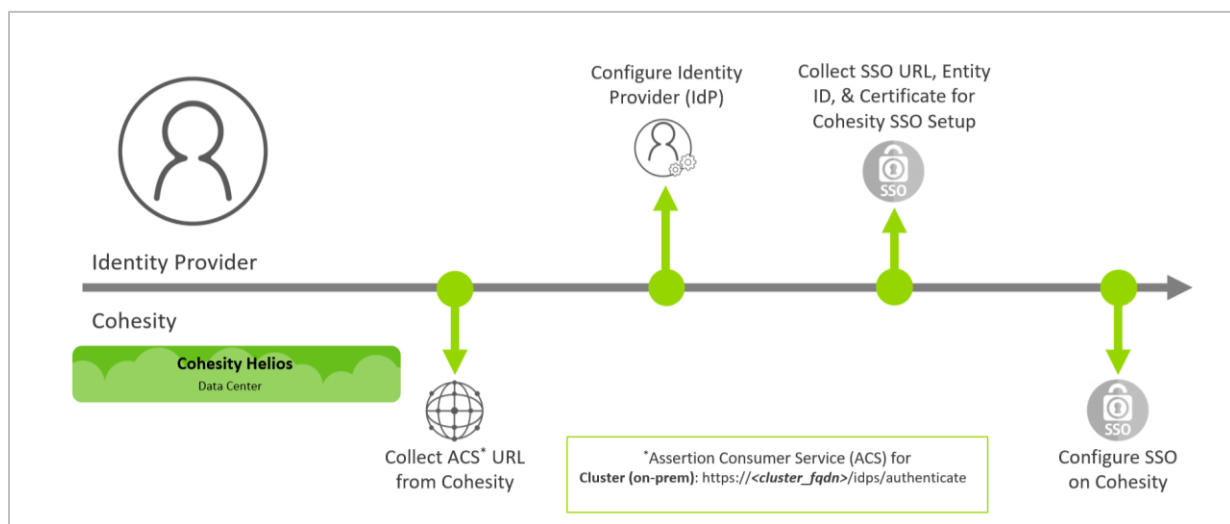

Cohesity Offers Seamless SSO Support

You can configure Cohesity to use an IdP for SSO access to both your dedicated Cohesity clusters as well as multi-tenant Cohesity clusters. On multi-tenant Cohesity clusters, you can configure SSO for each organization that is defined in Cohesity.

Integrate Cohesity with IdP

To integrate with an identity provider (IdP), you need to configure details on both the IdP platform as well as the service provider (SP)—in this case, Cohesity.

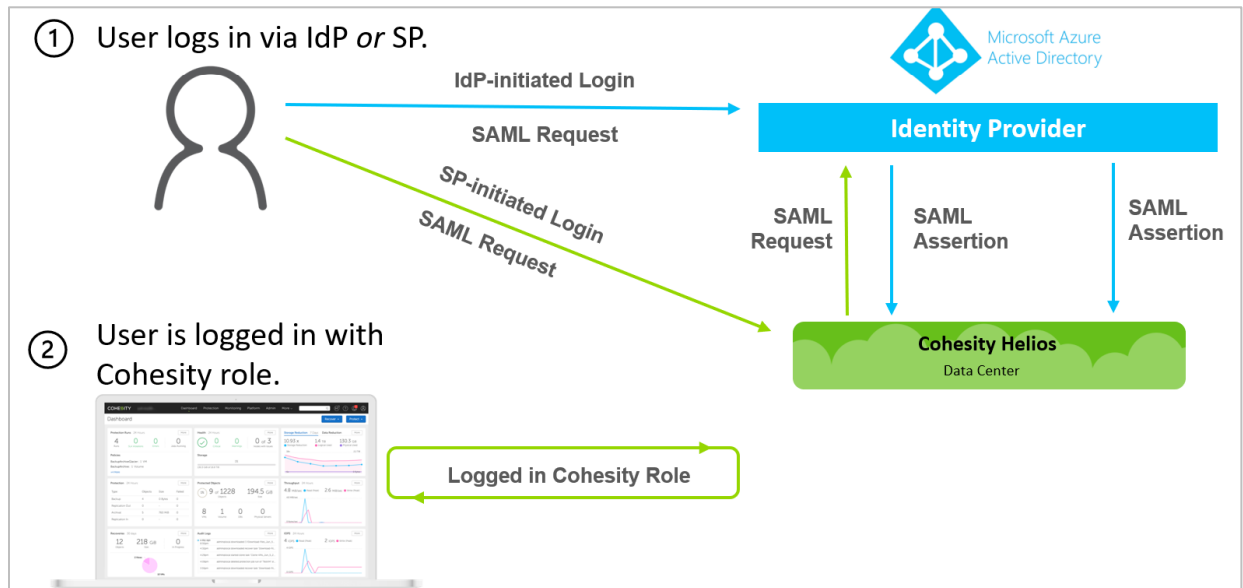

Figure 1: Integrate Cohesity with Identity Provider

The authentication workflow can start with either the IdP or the SP.

1. User logs in via either:
 - a) **IdP**: The identity provider, Azure AD, identifies and authenticates the user and sends a SAML 2.0 assertion to the service provider, Cohesity.
 - b) **SP**: A user requests to log in to the service provider, Cohesity, via SSO. The SAML 2.0 request is redirected to the identity provider, Azure AD. Azure AD identifies and authenticates the user, then sends a SAML 2.0 assertion to Cohesity.
2. Cohesity authorizes this user with the SAML 2.0 assertion and maps the user to the appropriate role.

Figure 2: IdP authenticates Cohesity User and Assigns Cohesity Role

Map SAML Attributes for SSO setup

When an IdP sends the SAML response to Cohesity, Cohesity looks for a few SAML attributes to identify the user who is logging in and assign the correct roles.

Those attributes include the “Email” or the “Login” attribute, and the “Groups” attribute if you are using [groups-based RBAC](#).

Pass “Email” or “Login” SAML Attribute to Cohesity

Cohesity expects either the “Email” or the “Login” SAML attribute in the SAML response. If both attributes are sent, the value of the “Login” attribute is read and used for role assignment and the “Email” attribute is ignored. If only the “Email” attribute is provided, then that is used for role assignment. If neither of these two attributes is provided, SSO will not work.

NOTE: The SAML attributes that Cohesity requires are not case-sensitive.

If Cohesity finds one of the two attributes, it lets the user into the Cohesity cluster home page and the default user role is assigned to that user unless you [create an SSO user](#) on Cohesity with a custom role.

Pass “Groups” SAML Attribute to Cohesity

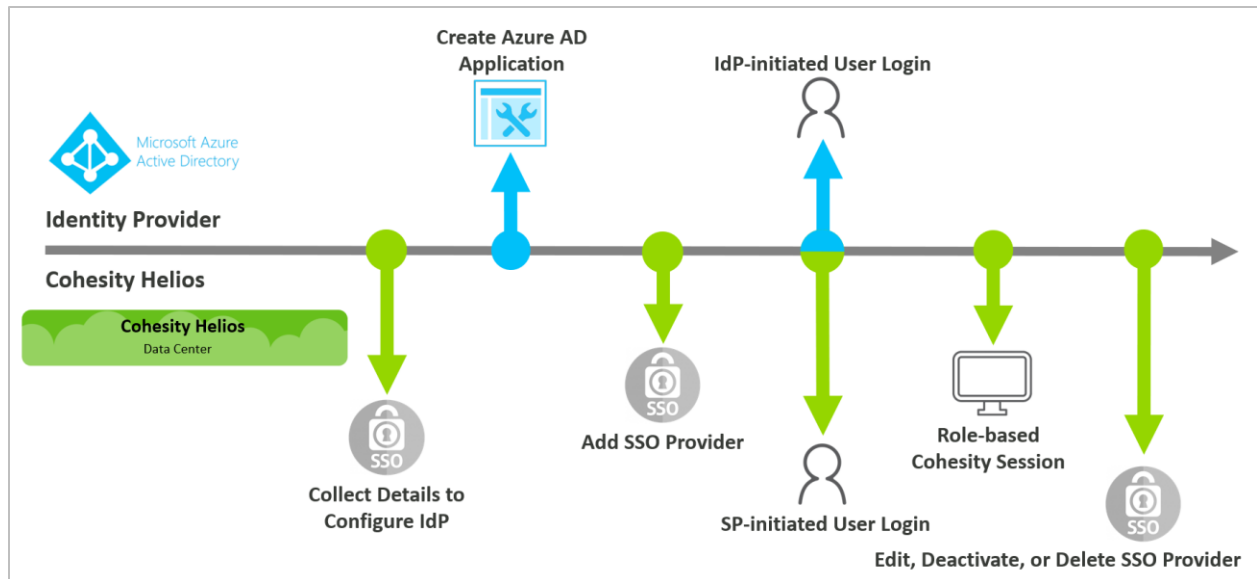

In general, it is a best practice to deploy SSO with [user groups-based RBAC](#) and assign custom roles to different user groups. To do so, you need to pass the “Groups” SAML attribute to Cohesity. The value of the “Groups” attribute is a list of groups that the user belongs to, and can include more than one group.

When Cohesity finds the “Groups” SAML attribute in the SAML response, it looks for any [SSO groups](#) that have been created on Cohesity. If the groups are found, the user is assigned the same role as the role assigned to the whole group. If no such SSO groups are present, the default role is assigned to the user. The default role is not mandatory but if the default role is not configured and there are no SSO groups created, the user cannot log in.

Configure Access Management with Azure AD

To configure and use Single Sign-on with Azure Active Directory on Cohesity, you need to configure certain parameters on the IdP and then use information from the IdP to configure SSO on Cohesity.

Figure 3: Cohesity Access Management with Azure AD SSO Lifecycle

Configure IdP

The first step to configure SSO on Cohesity is to supply some information to the IdP, Azure AD in this case. With these details, Azure AD can send the SAML response with the information about the authenticated user. The only piece of information you need from Cohesity is a URL.

- `https://<cluster_fqdn>/idps/authenticate`

Use this URL as the Entity ID and Reply URL when you create the Azure AD application below.

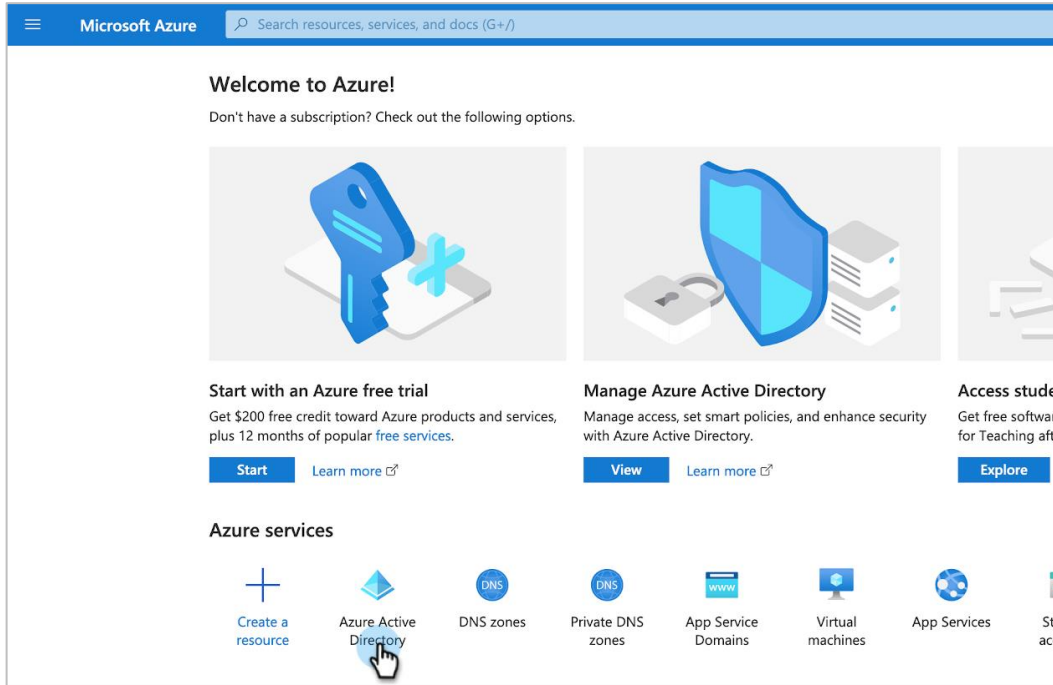

To configure the IdP:

1. [Create a Azure Active Directory application.](#)
2. [Collect the SSO URL, Entity ID, and certificate from Azure AD.](#)

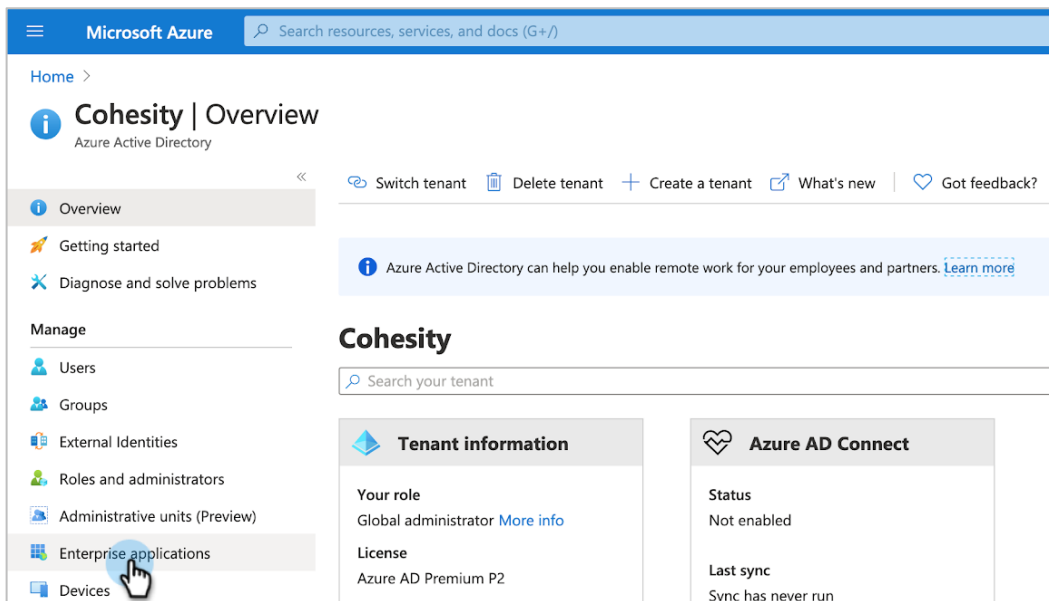

Create an Azure Active Directory Application

To configure Cohesity as an Azure AD service provider, you need to create an Azure AD SSO application:

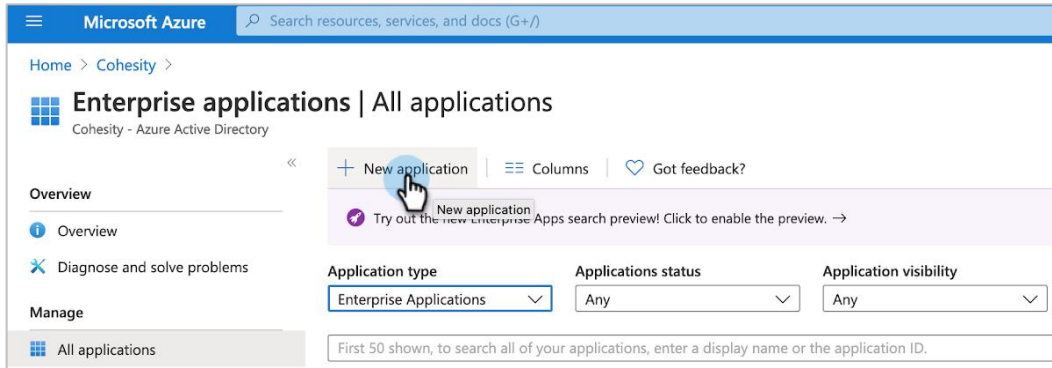

1. Log in to <https://portal.azure.com>. under **Azure services**, click **Azure Active Directory**.

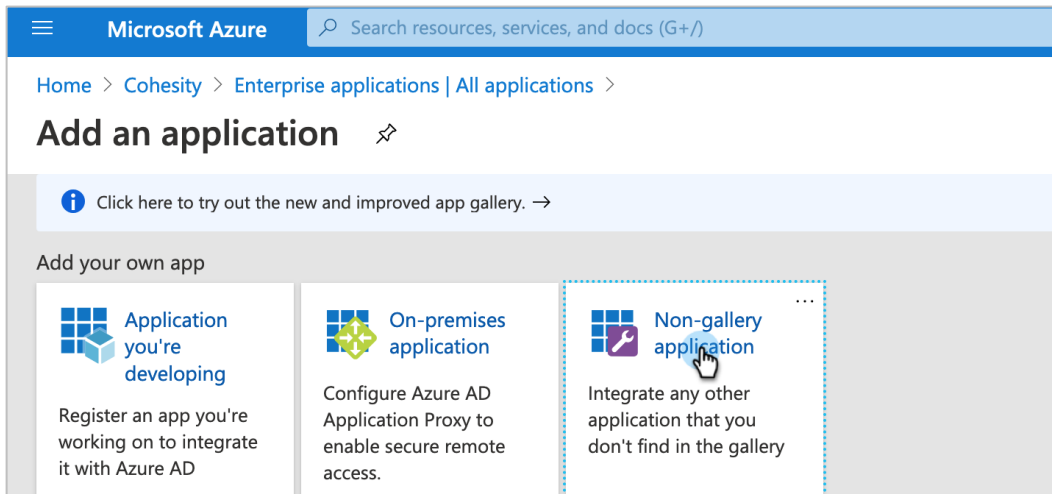

2. On the left, click **Enterprise applications**.

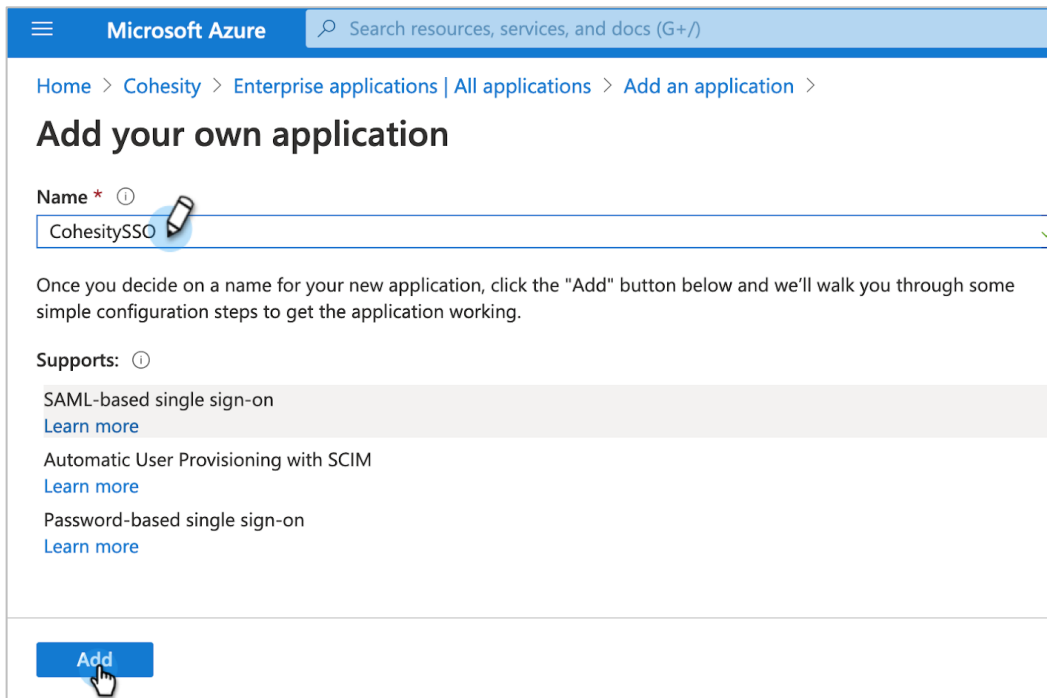

3. Under **All applications**, click **New application**.

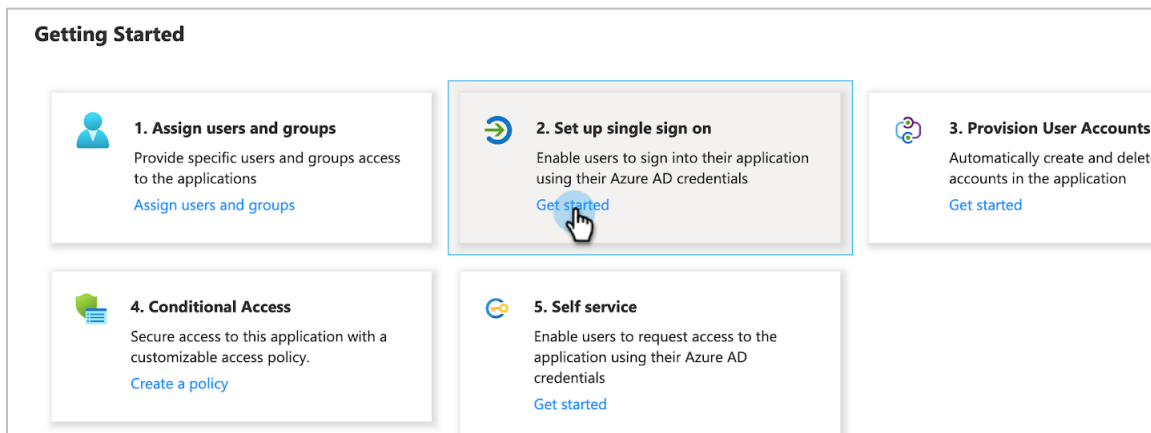

4. On the **Add an application** page, click **Non-gallery application**.

5. Enter a display name for your application and click **Add**.

6. On the **Set up single sign on** tile, click **Get started**.

7. Under **Select a single sign-on method**, choose **SAML**.

8. Under **Basic SAML Configuration**, enter:
 - a) **Identifier (Entity ID)**: `https://<cluster_fqdn>/idps/authenticate`.
 - b) **Reply URL (Assertion Consumer Service URL)**: Use the same value as for **Identifier**.

TIP: If you have multiple Cohesity clusters and you want to use this Azure AD application for all of them, you can use the additional cluster FQDNs to enter multiple **Identifiers** and **Reply URLs** in this step.

Basic SAML Configuration ✕

Save

Identifier (Entity ID) * ⓘ
The default identifier will be the audience of the SAML response for IDP-initiated SSO

Default

https://helios.cohesity.com/v2/mcm/idp/authenticate
✓
✔ ⓘ 🗑️

Reply URL (Assertion Consumer Service URL) * ⓘ
The default reply URL will be the destination in the SAML response for IDP-initiated SSO

Default

https://helios.cohesity.com/v2/mcm/idp/authenticate
✓
✔ ⓘ 🗑️

9. Under **User Attributes & Claims**, click **Add new claim**.

[Home](#) > [Cohesity](#) > [Enterprise applications | All applications](#) > [HeliosSSO | Single sign-on](#) > [SAML-based Sign-on](#) >

User Attributes & Claims

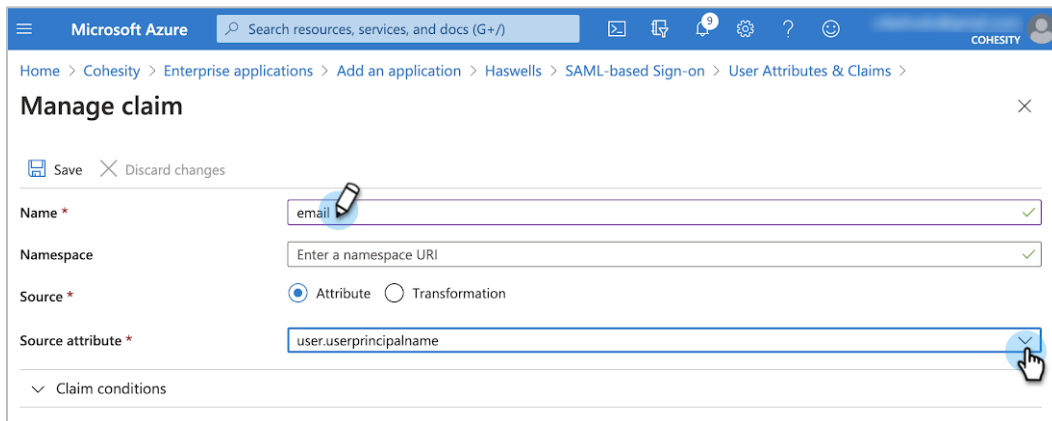

+ Add new claim
+ Add a group claim
☰ Columns

Required claim

Claim name	Value
Unique User Identifier (Name ID)	user.userprincipalname [nameid-for... ***

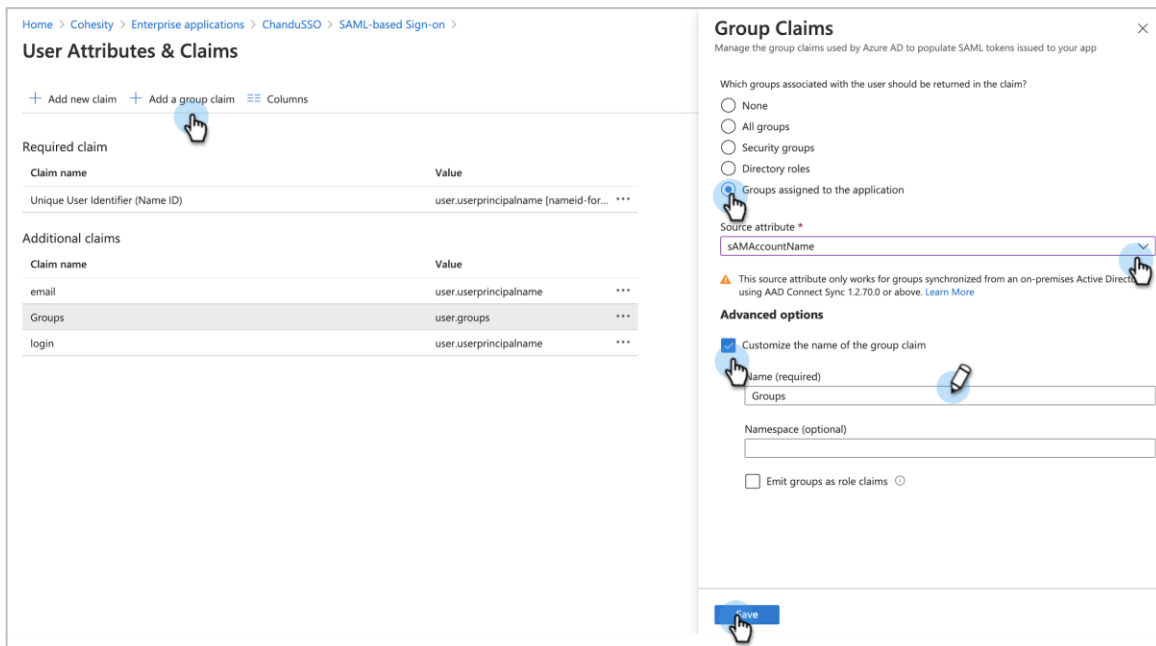

Additional claims

10. Enter a **Name** and select a **Source attribute**.

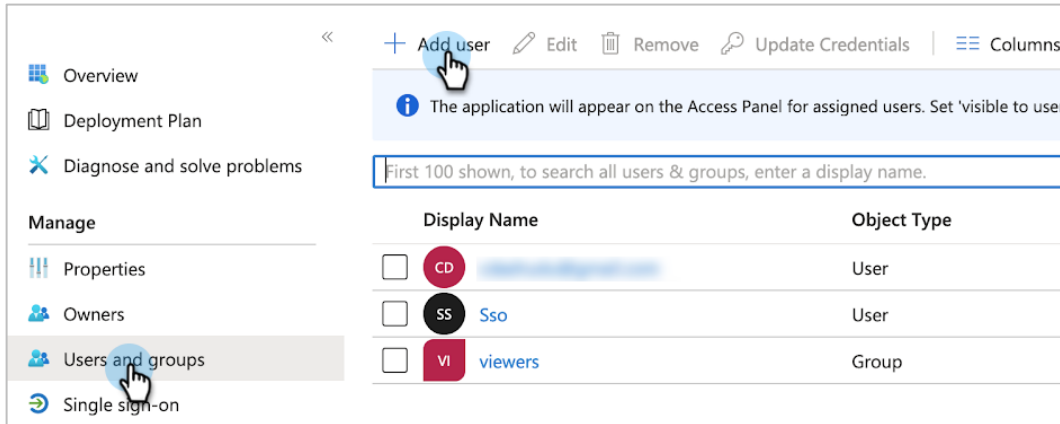

11. If you plan to use [user groups-based RBAC](#), you need to pass the “Groups” SAML attribute to Cohesity. To do so:

- a) Under **User Attributes & Claims**, click **Add a group claim**.
- b) Select the groups that you want to send in the claim.
- c) Select the **Source attribute** that you want to send in the value.
- d) Under the **Advanced options**, check the **Customize the name of the group claim**, enter “Groups” under **Name**, and click **Save**.

NOTE: To use source attributes like **SAMAccountName** to pass the user group name in the “Groups” SAML attribute make sure that Azure AD groups are synchronized from an on-premises Active Directory using Azure AD Connect Sync 1.2.70.0 or above. For more information, see [Azure AD Connect: Upgrade from a previous version to the latest](#) in the Microsoft documentation.

12. Under **Users and groups**, click **Add user** to assign the users and/or groups who should be able to access Cohesity.

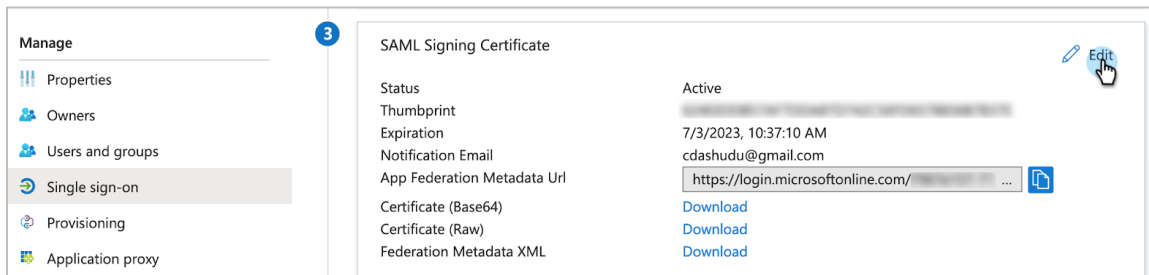

Collect SSO URL, Provider Issuer ID, and Certificate

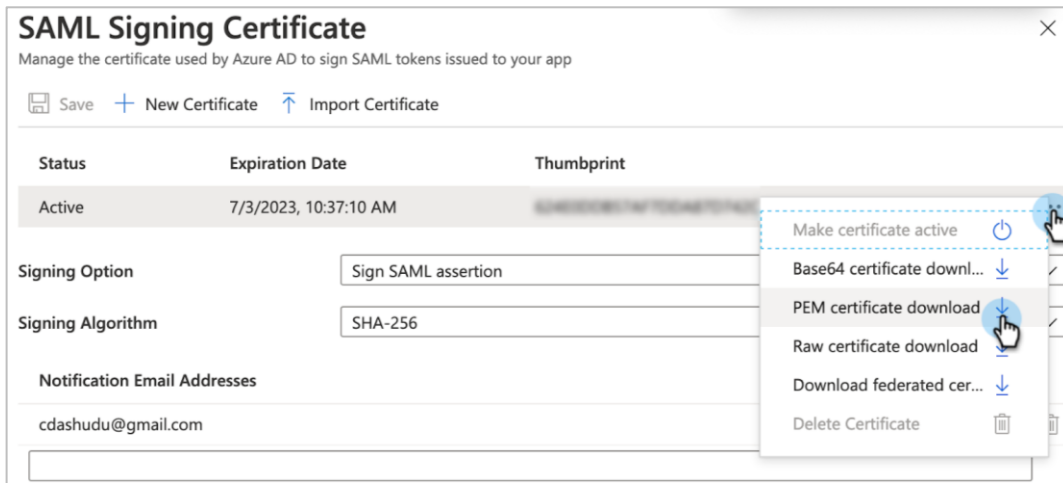

Now, on the next page in the form, you'll need to retrieve Azure AD information to configure SSO on the 'service provider' (Cohesity) for the IdP (Azure AD).

To collect the SSO URL, Entity ID, and certificate from the Azure AD application:

1. Log in to the Azure AD admin panel and navigate to **Azure Active Directory > Enterprise applications > [your application] > Single sign-on**.
2. Scroll down to **SAML Signing Certificate** and click **Edit**.

- Download the PEM certificate.

NOTE: Cohesity SSO only accepts *.pem format certificate.

To collect the URL for Cohesity Cluster,

- Scroll down to **Set up CohesitySSO** and copy the **Login URL**. You will use the **Login URL** value to [enter the Single Sign-On URL](#) when you add [Azure AD as an SSO provider](#) to Cohesity in the next section.

- Copy the **Azure AD Identifier**. You will use the Azure AD Identifier value to [enter the Cohesity Provider Issuer ID](#) when you add [Azure AD as an SSO provider](#) to Cohesity in the next section.

4 Set up CohesitySSO

You'll need to configure the application to link with Azure AD.

Login URL	https://login.microsoftonline.com/7967e157-714d...
Azure AD Identifier	https://sts.windows.net/7967e157-714d-429b-a5a...
Logout URL	https://login.microsoftonline.com/common/wsfed...

[View step-by-step instructions](#)

3. Click **Users and groups** on the left to assign the users and/or groups who should be able to access Cohesity to your Azure AD application.

The screenshot shows the Azure AD application configuration interface. On the left, the 'Users and groups' option is selected in the navigation menu. The main content area displays a table of assigned users and groups. At the top, there are action buttons: '+ Add user', 'Edit', 'Remove', 'Update Credentials', 'Columns', and 'Got feedback?'. A message states: 'The application will appear on the Access Panel for assigned users. Set 'visible to users?' to no in properties to prevent this. →'. Below this is a search bar: 'First 100 shown, to search all users & groups, enter a display name.' The table has the following data:

	Display Name	Object Type	Role assigned
<input type="checkbox"/>	CD [redacted]	User	User
<input type="checkbox"/>	SS Sso	User	User
<input type="checkbox"/>	VI viewers	Group	User

You now have the Azure AD details you'll need to configure it as your SSO provider in Cohesity in the next step.

Configure SSO Provider on Cohesity

Now that you have created your Azure AD application, use the SAML Signing Certificate and connection links to configure access management on Cohesity.

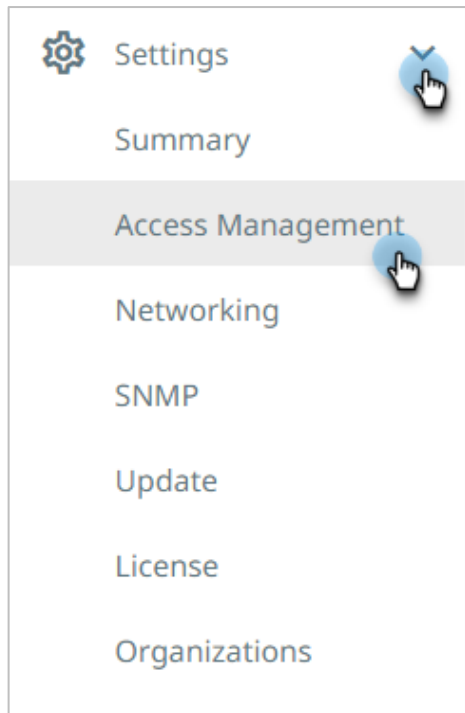

This is how you let Cohesity know where to send the user who is trying to sign in using the SSO option.

Add Azure AD as SSO Provider

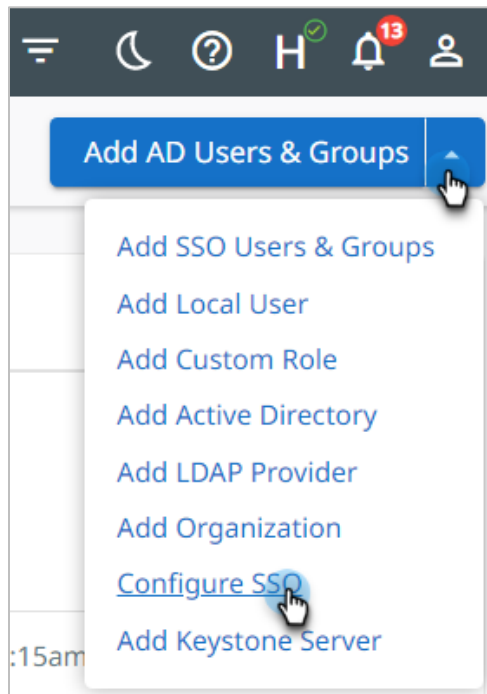

The first step is to use your Azure AD details to configure access management on Cohesity.

To add an SSO provider in Cohesity:

1. Log in to Cohesity as an administrator.
2. Navigate to **Settings > Access Management**.

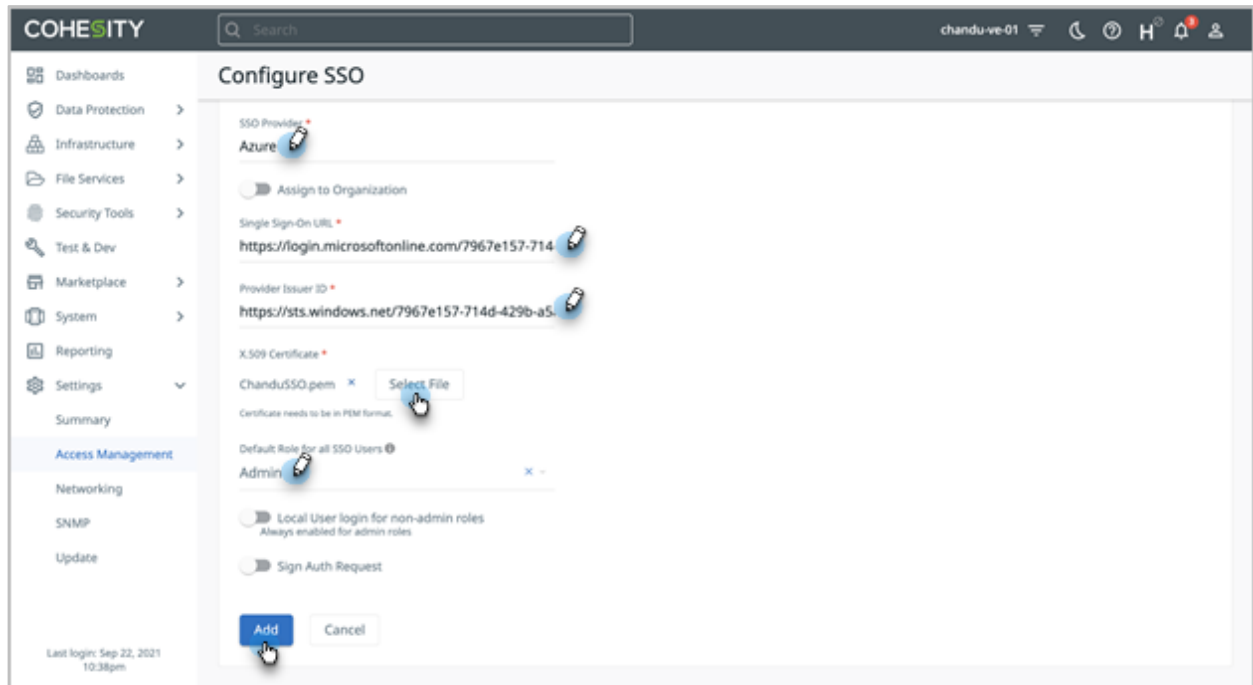

3. In the **Access Management** page, select **Add AD Users & Groups > Configure SSO**.

4. In the **Configure SSO** form, use the information [you captured earlier](#) to complete the following fields:
 - a) **SSO Domain**. Enter **Azure AD**. (Note that this name should be unique among all SSO provider domain names.)
 - b) **SSO Provider**. Enter **Azure AD**.

- c) **Single Sign-On URL.** Enter the Login URL that [you copied earlier](#) for Cohesity Cluster.
 - a. **Provider Issuer ID.** Enter the **Azure AD Identifier** that [you copied earlier](#).
 - d) **X.509 Certificate.** Click **Select File** and browse to select the *.pem file that [you downloaded earlier](#).
 - e) **Default Role for all SSO Users.** Choose a default role for any user who logs in using Azure AD. If you want to specify individual roles for users and groups, see [Add SSO Users and Groups](#) below and assign the desired roles. You can change this option later.
5. Click **Add**.

Cohesity validates the connection to Azure Active Directory. If the connection succeeds, Azure AD is added to the SSO provider list. Users can start accessing Cohesity via their Azure AD home page or the sign-in page by clicking the **Sign in with SSO** link.

Add SSO Users and Groups

During the SSO setup step, you can optionally add a default role for all SSO users. This might not be desirable in all cases, and you might want to give different access rights to different users and/or groups. There are two ways of doing this. You can:

- [Add SSO users](#) and assign rights to them individually.
- [Add an SSO group](#) and assign it the desired role.

To add SSO users and groups:

1. Log in to Cohesity, select the **Settings > Access Management**, and click the **SSO** tab.
2. Click **Add SSO Users & Groups** in the top right corner.
3. In the **Add SSO Users & Groups** form, click **SSO Users and Groups** and then choose which you are adding:
 - a) Add the **SSO Users** and assign them the desired role, and then click **Add**.

Add SSO Users & Groups

Local User Active Directory Users and Groups (Add an Active Directory) SSO Users and Groups

Assign Cluster management permissions to SSO Users and Groups.

Edit SSO Provider

Once an SSO provider has been added, you can edit, delete, or deactivate it.

To edit an SSO provider:

1. In Cohesity, select **Settings > Access Management** and click the **SSO** tab.
2. Open the **Actions Menu** on the right and select **Edit**.

3. Change the options as needed and click **Update**.

Cohesity validates the connection to Azure Active Directory using the new information.

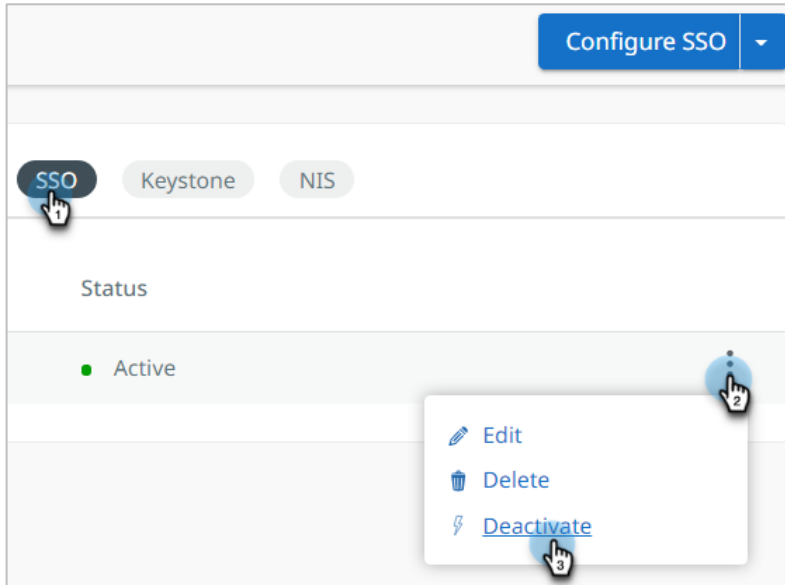

Deactivate SSO Provider

You might want to deactivate an SSO provider for testing or investigation purposes. Deactivation does not delete the provider configuration, so you can activate it later. Once deactivated, users associated with the Azure AD provider will no longer bypass the Cohesity sign-in page.

To deactivate or activate an SSO provider:

1. Log in to Cohesity and, select **Admin > Access Management** and click the **SSO** tab.

2. Locate the SSO provider, open the **Actions Menu** on the right, and select **Deactivate** or **Activate**.

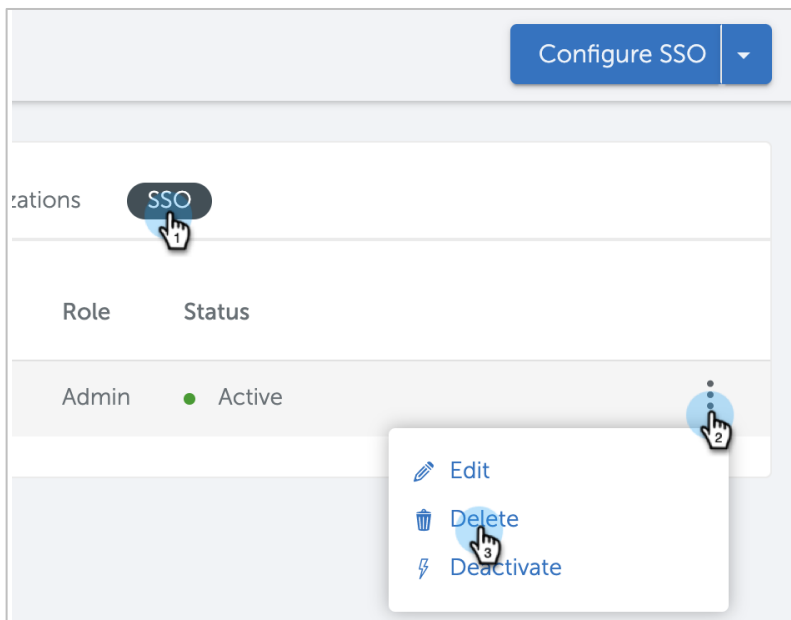

Delete SSO Provider

You can permanently delete an SSO provider if you no longer need it. Once deleted, users associated with the Azure AD provider will no longer bypass the Cohesity sign-in page.

To delete an SSO provider:

1. Log in to Cohesity, select **Admin > Access Management**, and click the **SSO** tab.
2. Locate the SSO provider, open the **Actions Menu** on the right, and select **Delete**.

ABOUT COHESITY

[Cohesity](#) is a leader in AI-powered data security and management. Aided by an extensive ecosystem of partners, Cohesity makes it easier to protect, manage, and get value from data – across the data center, edge, and cloud. Cohesity helps organizations defend against cybersecurity threats with comprehensive data security and management capabilities, including immutable backup snapshots, AI-based threat detection, monitoring for malicious behavior, and rapid recovery at scale. Cohesity solutions are delivered as a service, self-managed, or provided by a Cohesity-powered partner. Cohesity is headquartered in San Jose, CA, and is trusted by the world's largest enterprises, including six of the Fortune 10 and 44 of the Fortune 100.
